## **NOAA Technical Memorandum NMFS**

The National Oceanic and Atmospheric Administration (NOAA), organized in 1970, has evolved into an agency which establishes national policies and manages and conserves our oceanic, coastal, and atmospheric resources. An organizational element within NOAA, the Office of Fisheries is responsible for fisheries policy and the direction of the National Marine Fisheries Service (NMFS).

In addition to its formal publications, the NMFS uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series, however, reflect sound professional work and may be referenced in the formal scientific and technical literature.

## NOAA Technical Memorandum NMFS

This TM series is used for documentation and timely communication of preliminary results, interim reports, or special purpose information; and have not received complete formal review, editorial control, or detailed editing.

## ABSTRACT

This report provides ichthyoplankton and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) cruises conducted off California and Baja California in 1960. It is the tenth report in a series that presents these data for all biological-oceanographic CalCOFI surveys from 1951 to the present. A total of 1814 stations was occupied during 10 monthly multivessel cruises over the quarter-million square mile survey area which extends from the California-Oregon border to Cape San Lucas, Mexico and seaward to several hundred miles. The data are listed in a series of 6 tables; the background, methodology, and information necessary for interpretation and quantitative analysis of the data are presented in an accompanying text. All pertinent station and tow data, including volumes of water strained and standard haul factors are listed in the first table. Another key table lists, by station and month, standardized counts of each of the 158 larval fish categories identified from survey samples. This and previous and subsequent reports make the CalCOFI ichthyoplankton and station data available to all investigators and serve as guides to the newly developed computer data base.

## INTRODUCTION

This report, the tenth of a series, provides ichthyoplankton and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) joint biological-oceanographic survey cruises conducted in 1960. This program was initiated in 1949, under the sponsorship of the Marine Research Committee of the State of California, to study the population fluctuations of the Pacific sardine (*Sardinops sagax*) and the environmental factors that may play a role in such fluctuations. CalCOFI, known as the California Cooperative Sardine Research Program from 1949 to 1953, was made up of representatives of the South Pacific Fisheries Investigations (SPFI) of the U.S. Fish and Wildlife Service [now the La Jolla Laboratory, National Marine Fisheries Service (NMFS)], the Scripps Institution of Oceanography (SIO), the California Department of Fish and Game (CDFG), the California Academy of Sciences (CAS) and the Hopkins Marine Station of Stanford University. The first three of these agencies supplied ships and personnel to conduct the sea surveys. NMFS processed the plankton samples and analyzed the ichthyoplankton from them. SIO processed and analyzed the hydrographic samples and measurements and also analyzed invertebrate groups from the plankton samples.

The boundaries, station placement, and sampling frequency for the CalCOFI survey area were based on the results of joint biological and oceanographic cruises conducted by NMFS and SIO during 1939-41. Those cruises were designed to collect sardine eggs and larvae and associated hydrographic data over the entire areal and seasonal spawning range of the species. On these survey cruises, plankton tows were made to 70 m, a depth which

encompassed the vertical distribution of sardine eggs and larvae. Wide-ranging joint biological and oceanographic survey cruises were resumed in 1949 with sardine as the focus; however, an increasing interest in other biological components resulted in the deepening of standard tows to 140 m in 1951. This marked the beginning of truly quantitative ichthyoplankton sampling on CalCOFI surveys.

Data resulting from CalCOFI surveys in 1960 have been published in a number of forms. Hydrographic data (Univ. of Calif., SIO, 1961, 1962) and zooplankton volumes (Thrailkill, 1969; Smith, 1971) were presented in standard formats. Distributional maps of larvae of 5 taxa taken on CalCOFI surveys during 1960 are presented in the CalCOFI Atlas series: northern anchovy (*Engraulis mordax*), Kramer and Ahlstrom, 1968; jack mackerel (*Trachurus symmetricus*) and Pacific hake (*Merluccius productus*), Ahlstrom, 1969; Pacific sardine (*Sardinops sagax*), Kramer, 1970; rockfish (*Sebastes spp.*), Ahlstrom et al., 1978. Other atlases provided distribution maps of 6 mesopelagic fish larvae (Ahlstrom, 1972) and 8 flatfish taxa (Ahlstrom and Moser, 1975) taken during 1960.

A computer data base for eggs and larvae of sardine and anchovy and for larvae of hake, and jack and Pacific mackerels was established in 1969. The development of a data base for other fish larvae is a complex undertaking because competency of identification has evolved steadily over the past 38 years. We began the task of producing a CalCOFI ichthyoplankton data base and associated data report series in 1983. All available original records for 1960 were subjected to an extensive verification and editing process to produce this report. This and previous (Ambrose et al., 1987 a,b; Sandknop et al., 1987 a,b; Stevens et al., 1987 a,b,c; Sumida et al., 1987 a,b) and subsequent reports make the CalCOFI ichthyoplankton and station data available to all investigators and serve as guides to the computer data base. The data base will be modified when additional errors are discovered and when composite taxa from the earlier years are reidentified. These reports are the fundamental reference documents against which subsequent changes in the data base can be compared.

#### SAMPLING AREA AND PATTERN

In 1960, CalCOFI survey cruises were conducted at monthly intervals, except for November and December. A total of 1814 stations included in this data base was occupied on 10 cruises, with an average of 181 stations per cruise (range 41-333). Coverage of the survey station pattern varied among cruises and the entire quarter-million square mile survey area was not covered on any single cruise (Figures 1-11, Table 1). The area off northern California (lines 40-57) was covered on only two cruises (January, April); two stations (50,55) were occupied on line 50 in July. Coverage off central California (lines 60-77) was more consistent with all major lines occupied in January,

April, and October; only two lines were occupied in this region in February, March, and May-July. The area between Pt. Conception, California and Pt. San Juanico, Baja California (lines 80-137) was surveyed on all cruises; only lines 103-121 were occupied in August. The area off southern Baja California (lines 140-157) was surveyed in January and April. Coverage extended seaward to station 200 (approximately 600-700 miles offshore) on lines 60-90 (Cruises 6007, 6010) but typically did not extend beyond station 100 (approximately 200-300 miles offshore)<sup>1</sup>.

Five vessels were employed on these cruises: the *Black Douglas* and *Hugh M. Smith*, of NMFS, and the *Horizon*, *Orca*, and *Spencer F. Baird* of SIO. Two to three vessels participated on each cruise with two being the average number. The *Black Douglas* was used on all cruises. The other four vessels participated on a total of 11 cruises (Univ. of Calif., SIO, 1961, 1962).

#### SAMPLING GEAR AND METHODS

The standard CalCOFI net used from 1949 to 1969 had a 1-m diameter mouth opening ( $0.785 \text{ m}^2$  area) and an overall length of about 5 m. The net was constructed of 30xxx gauze, a heavy duty grade of silk bolting cloth, with a mesh size of 0.55 mm after shrinkage. The last 40 cm of the cone and the cod end were constructed of 56xxx grit gauze which had a mesh size of 0.25 mm after shrinkage. The net ring was fastened to a short 3-lead bridle connected to several meters of line which attached to the towing cable by a clamp. A current meter was suspended in the center of the net mouth to measure volume of water filtered (see Kramer et al., 1972, for further details).

The standard tow from 1951 through 1968 was an oblique haul to 140 m depth (to 15 m of the bottom in shallow areas) designed to filter a constant amount of water per depth interval (ca.  $3\text{m}^3/\text{m}$  of depth) over the vertical range of most ichthyoplankters. Hauls were made at a ship speed of 1.5-2.0 knots and initiated by clamping the net line to the towing cable with the 45 kg terminal

<sup>1</sup>CalCOFI lines (Figure 12) are arranged perpendicular to the coastline and extend from the Canadian border (line 10) to below Cape San Lucas, Baja California (line 157). Stations were established on the basis of a perpendicular to line 80 (off Pt. Conception) at a point designated as station 60. Stations were plotted seaward and shoreward from station 60 on each line. Cardinal CalCOFI lines (those ending in "0") are 120 miles apart and usually bracket two ordinal lines (ending in "3" or "7"), so that lines are 40 miles apart over most of the pattern. Cardinal stations are 40 miles apart and typically these are separated by a station number ending in "5" so that stations are 20 miles apart out to station 90 on most lines. Stations are placed at closer intervals near the coast and islands to accommodate these features (see Kramer et al., 1972 for further details).

weight about 10-15 m below the surface. The net was lowered to 140 m depth by paying out 200 m of wire over a 4 minute period (35 m of depth/min.). After fishing at depth for 30 seconds, the net was retrieved at 20 m/min. (14 m depth/min.). The angle of stray of the towing cable was recorded every 30 seconds and maintained at 45° ( $\pm 3^\circ$ ) by adjusting the ship speed and course. After reaching the surface, the net was washed down and the samples preserved in 5% formalin buffered with sodium borate. Flowmeter readings were made at the beginning and end of each tow. Detailed descriptions of gear and methods are given by Ahlstrom (1953), Kramer et al. (1972), and Smith and Richardson (1977).

#### LABORATORY PROCEDURES

Laboratory processing began with the determination of a displacement volume for each sample (methods described in Staff, SPFI, 1953 and Kramer et al., 1972). Zooplankton volumes (including ichthyoplankton) of samples collected in 1960 are listed in Thrailkill (1969) and presented graphically in Smith (1971).

Sorting involved the removal of ichthyoplankton from the sample and identification and separation of eggs and larvae of selected species (see introduction). Usually, each sample was sorted completely; however, some of the samples were fractioned into aliquots using a Folsom plankton splitter (McEwen et al., 1954) prior to sorting. Several criteria<sup>2</sup> were used to determine whether a sample was fractioned: samples containing an abundance of thaliacians and coelenterates and exceeding 150 ml in total plankton volume were fractioned (to 50%, 25%, 12.5%, or 6.25%) to approximate a reduced volume of 50 ml for sorting; samples with an excessive quantity of fish eggs and/or larvae were occasionally fractioned to expedite the sorting process in order to meet scheduled deadlines. If the identified fraction of an aliquot yielded rare or interesting species of fish larvae, the remaining fraction was frequently sorted and identified with the intent of finding additional specimens. Aliquot percentages for fractioned samples from 1960 are listed in Table 1 under the "Percent Sorted" column.

A "standard haul factor" (SHF) was calculated for each tow to make them comparable and allow estimations of areal abundance. This factor adjusts the number of eggs or larvae in a haul to the number in 10 m<sup>3</sup> of water strained per meter of depth fished. If the vertical distribution of the species has been encompassed, then the adjusted value is equivalent to the number under 10 m<sup>2</sup> of sea surface. The SHF is calculated for each haul by the formula:

---

<sup>2</sup>Personal communication, James R. Thrailkill, National Marine Fisheries Service, Southwest Fisheries Center, La Jolla, CA.

$$SHF = \frac{10 D}{V}$$

where  $D$  = depth of haul = cosine of the average angle of stray of the towing cable multiplied by cable length (m)

$V$  = total volume of water ( $m^3$ ) strained during the haul

$$V = R \cdot a \cdot p$$

where  $R$  = total number of revolutions of the current meter during the haul

$a$  = area ( $m^2$ ) of the mouth of the net

$p$  = length of column of water (m) needed to produce one revolution of the current meter.

Tow depth, volume of water strained, and standard haul factor are listed in Table 1 for each tow taken during 1960. Detailed descriptions of factors involved in calculating these values are presented in Ahlstrom (1948), Kramer et al. (1972), and Smith and Richardson (1977).

#### IDENTIFICATION

Identification of ichthyoplankton species beyond those separated during the sorting process was carried out by a separate group of specialists. Ontogenetic stages of fishes are inherently difficult to identify and this is further complicated by the large number and diversity of species which contribute to the ichthyoplankton of the California Current region. Most identifications were accomplished by establishing ontogenetic series on the basis of morphology, meristics, and pigmentation and then identifying these series by relating them to known metamorphic, juvenile, or adult stages with overlapping features (Powles and Markle, 1984). A total of 156 taxa was identified for 1960, with 82 taken to species, 33 to genus, 34 to family, and 7 to order or suborder. Some of the developmental series recognized at the time of initial identification could not be assigned scientific names, particularly in the Bathylagidae, Myctophidae, and Pleuronectiformes. These were given descriptive names, which later were changed to scientific names as they became known.

The task of producing a reliable and equitable ichthyoplankton data base required extensive procedures to verify, correct, and edit the original identifications. The primary data source was the original identification sheets (see Kramer et al., 1972, for examples); however, a critical resource used in all phases of this process was the CalCOFI

ichthyoplankton collection in which the samples are archived. Throughout the course of CalCOFI ichthyoplankton studies, samples have been identified to the lowest taxon possible. In reviewing these identifications for the data base, our approach has been conservative and we have preserved those identifications and counts which we could confirm, while correcting as many of the errors as possible. During the coding of the identification sheets, the "descriptive types" were assigned scientific names and reexamined, if necessary. After computer entry, taxonomic errors and inconsistencies in the data base were corrected and the most obvious identification errors were corrected. Our current knowledge of ichthyoplankton techniques coupled with a precise understanding of the development of identification competency in the program over the years allowed us to critically judge the historical records. Identifications were changed to different taxa, lumped to a higher taxonomic category, or given a more precise taxonomic name. In many cases, identifications of a taxon were inconsistent among cruises in a year, because of varying competency of identifiers. These records were made equitable by lumping to the higher taxonomic category to avoid biases that could result in quantitative misinterpretations.

Next, statistical, seasonal, and geographic outliers were identified, employing a series of graphic summaries and listings. Examination of geographic outliers proved to be especially effective because of our accumulated knowledge of species distributions. In the course of examining samples for these outliers, other identification errors were discovered and eventually all taxa were scrutinized to some extent. Lastly, certain taxa were reexamined in all samples for the entire CalCOFI time series. These taxa were selected because of their commercial, ecological, phylogenetic, or zoogeographic importance or because taxonomic confusion was at the ordinal level. The following is a list of the taxa for 1960 which received special attention, with explanations and caveats intended to aid in quantitative interpretations:

*Anguilliformes* - tentative and sporadic identifications to family or lower taxon lumped to order.

*Sardinops sagax* - all specimens south of line 120 checked for misidentification of *Opisthonema* spp.

*Engraulidae* - includes nearshore taxa (mostly *Anchoa* spp.) large enough to separate from *Engraulis mordax*. Some nearshore samples of small *E. mordax* may contain other anchovy genera, but could not be differentiated.

*Nansenia* spp. - all specimens checked and identified as *N. candida* or *N. crassa*; all specimens of these species near their range boundaries checked.

*Bathylagus milleri* - all specimens checked.

*Osmeridae* - all specimens checked.

*Sternopychidae* - tentative and sporadic identifications of hatchetfishes to genus were lumped to family.

*Bathophilus* spp. - all specimens checked.

*Tactostoma macropus* - all specimens checked.

*Myctophiformes* - all specimens checked.

*Scopelarchidae* - tentative and sporadic identifications to genus lumped to family.

*Lampanyctus* spp. - tentative and sporadic identifications to species (mostly descriptive types) lumped to genus; identification of *L. regalis* and *L. ritteri* began in 1954.

*Lampanyctus regalis* - underrepresented because of inability to differentiate small larvae (<5 mm) from those of other species of the genus; counts may include other species of the genus because of difficulty in identifying larvae of this large and complex genus.

*Lampanyctus ritteri* - comment for *L. regalis* applies to this species.

*Stenobrachius leucopsarus* - all specimens south of line 120 checked.

*Diogenichthys atlanticus* - all specimens at margins of range checked.

*Diogenichthys laternatus* - all specimens at margins of range checked.

*Electrona rissoii* - recognition of this species was inconsistent and others may be included in *Protomyctophum crockeri* or *Myctophidae*.

*Hygophum* spp. - all specimens reidentified to species; residuals are small, poorly preserved specimens.

*Myctophum aurolaternatum* - specimens checked; originally called "Astronesthidae".

*Protomyctophum crockeri* - some samples on northern lines may contain *P. thompsoni*, which was not identified at the time.

*Symbolophorus californiensis* - all specimens south of line 120 checked for confusion with *Hygophum* spp., stemming from descriptive names.

*Bregmaceros* spp. - all gadiform types (see Index), except *Merluccius productus* and *Macrouridae*, reexamined.

Ophidiiformes - this category did not exist originally and ophidiiform larvae were included in *Brosmophysis marginata*, Carapidae, "Otopholidium", "Zoarcidae", and "blenny"; identifications of *B. marginata* and Carapidae proved to be mostly correct and "Zoarcidae" to be a yet unidentified ophidiiform species; all "Otopholidium" and "blenny" were reexamined and the former included *Ophidion scrippsae*, *Chilara taylori* and other ophidiiform taxa (moved to order); "blenny" contained *O. scrippsae*, *C. taylori*, and other ophidiiform taxa in addition to true blennioids.

Ceratioidei - identifications of this group were inconsistent and additional specimens may be in the unidentified fish larva category.

Trachipteridae - tentative and sporadic identifications to genus were lumped to family.

*Melamphaes* spp. - all identifications ascribed to Melamphaidae were reexamined and assigned to genus (*Melamphaes*, *Poromitra*) or species (*Scopelogadus bispinosus*). Larvae originally identified as *Melamphaes* spp. were not reexamined and this category may contain other melamphaid genera.

Cottidae - some samples may include specimens of *Scorpaenichthys marmoratus*, hexagrammids (e.g., *Oxylebius pictus*, *Zaniolepis* spp.), and some blennioids (e.g., *Hypsoblennius* spp.).

*Oxylebius pictus* - all specimens checked.

*Zaniolepis* spp. - all specimens checked.

*Sebastes* spp. - in addition to other scorpaenid genera, category includes *Prionotus* spp., serranids, scombrids, and other spiny-headed shorefishes, particularly in samples south of line 120.

Blennioidei - this is the residual of the completely reexamined "blenny" category, which also contained various misidentified ophidiiforms, and is now restricted to members of northern stichaeioid families and true blennioids (other than *Hypsoblennius* spp.) in the southern part of the pattern).

*Hypsoblennius* spp. - some specimens remain in Cottidae.

Clinidae - some specimens remain in Cottidae or unidentified fish larva category.

Labridae - tentative and sporadic identifications to genus were lumped to family.

Pomacentridae - specimens checked; now includes species other than *Chromis punctipinnis*, primarily in the south.

*Chromis punctipinnis* - records south of about line 120 may include other pomacentrid taxa.

*Mugil* spp. - all specimens checked.

*Apogonidae* - all specimens checked.

*Carangidae* - all specimens checked; tentative and sporadic identifications to genus or species (except *Trachurus symmetricus*, *Seriola* spp., and *Seriola lalandi*) were lumped to family.

*Seriola* spp. - checked; probably *S. rivoliana*.

*Seriola lalandi* - all specimens checked.

*Gerreidae* - tentative and sporadic identifications to genus were lumped to family.

*Haemulidae* - tentative and sporadic identifications to genus lumped to family.

*Girella nigricans* - all specimens checked.

*Medialuna californiensis* - all specimens checked.

*Caulolatilus princeps* - all specimens checked.

*Sciaenidae* - tentative and sporadic identifications to genus lumped to family.

*Scombridae* - all larvae identified to this family or constituent taxa (except *Scomber japonicus*) were reexamined and reassigned; underrepresentation or absence of these taxa may be attributed to misidentification or they may be in the unidentified fish larva category; most specimens of scombrid taxa (except *S. japonicus*) from 1960 were missing from archived collection and were lumped to family.

*Nomeidae* - tentative identifications to genus lumped to family.

*Pleuronectiformes* - all available specimens of this category (originally called "flatfish") were examined and reidentified; residuals are small, poorly preserved specimens.

*Bothidae* - all specimens examined and reassigned; most were assigned to various paralichthyid genera or to *Bothus* spp.

*Citharichthys* spp. - all larvae identified to genus or to a species of the genus from 1954 through 1960 were checked and identified to species; residuals are small, poorly preserved specimens or those with variable taxonomic characters.

*Etropus* spp. - larvae of this taxon were originally lumped with *Citharichthys* spp.; present records result from complete reidentification of *Citharichthys* spp.

*Hippoglossina* spp. - all specimens of this genus (originally called "pigmented bothid") were examined and those not assigned to *H. stomata* were left at the genus (probably are *H. tetrophthalmus*).

*Paralichthys* spp. - all specimens of this genus were examined and most were assigned to *P. californicus* or *Xystreurus liolepis*.

*Syacium ovale* - all specimens examined (originally called "spiny-headed bothid").

*Xystreurus liolepis* - originally misidentified as *Paralichthys californicus*; all specimens reidentified.

*Glyptocephalus zachirus* - all specimens examined.

*Hypsopsetta guttulata* - specimens were originally identified as *Pleuronichthys* spp.

*Microstomus pacificus* - all specimens examined.

*Pleuronichthys* spp. - all larvae of this genus and constituent species were examined and assigned to species; residuals are small, poorly preserved specimens.

*Psettichthys melanostictus* - all specimens examined.

#### COMPUTER ENTRY AND EDITING

Each taxon on the original identification sheets was given a 3-digit code based on the list of codes in Haight et al. (1979). Taxon codes and counts from these sheets were keypunched by cruise and station, along with pertinent station and tow data and entered into the VAX 11/780 computer at the University of California, San Diego Computing Center. After entries were completed for an entire year, print-out listings of taxa and counts on each station were compared with the original data sheets to eliminate keypunch errors. Next, data in the file were cross-checked with data on an existing file which contained: station and tow data; numbers of eggs of sardine, anchovy, and saury (*Cololabis saira*); numbers of larvae of sardine, anchovy, hake, jack mackerel, and Pacific mackerel; total number of fish eggs; and total number of fish larvae.

Discrepancies in ichthyoplankton data in these two files were corrected by inspecting original records from the sorting laboratory, the original ichthyoplankton identification sheets, and the samples themselves. Station and tow data discrepancies

between the two files were corrected by reviewing ships' logs and deck tow sheets, original records from the sorting laboratory, cruise announcements, publications, header information on the ichthyoplankton identification sheets, and station plots generated for each cruise. Eventually all station and tow data were checked by comparing these sources.

The corrected ichthyoplankton data base was then examined statistically and outliers were found and checked as above. Distributional plots were then prepared for each taxon and these were checked by reviewing the data sources mentioned above and by examining archived specimens. A listing of each taxon by station (Table 4) was produced, which became the primary document for subsequent checks. Misidentifications found in geographic outlier checks and other misidentifications and data problems discovered in the course of examining archived samples resulted in several iterations of Table 4. Finally, totals in Table 4 were checked against annual summaries of incidence and abundance (Tables 2 and 3). Ecological analyses of the data (Moser et al., 1987) were conducted concurrently with editing procedures and provided cross-checks that allowed correction of errors.

#### SPECIES SUMMARY

Larvae of northern anchovy (*Engraulis mordax*) represented 58% of all fish larvae taken on CalCOFI cruises during 1960 and numbered eight times as many as the gonostomatid *Vinciguerria lucetia*, the next most abundant species with 7% of the total larvae (Table 2, 3). Northern anchovy also ranked first in incidence; *V. lucetia* ranked 3rd. The next most abundant species was Pacific hake, *Merluccius productus*, with 6.6% of total larvae; it ranked 7th in occurrence. A deepsea smelt, *Leuroglossus stibius*, ranked 4th in abundance (5.9%) and 5th in incidence. The myctophid *Triphoturus mexicanus* ranked 5th in abundance, but ranked 2nd in occurrence suggesting relatively small sample sizes. Larvae of *Sebastes* spp., a composite of about 70 species, ranked 6th in abundance and 4th in incidence. Another myctophid, *Stenobrachius leucopsarus*, also ranked in the top ten in both abundance (7th) and occurrence (9th). Pacific sardine (*Sardinops sagax*), jack mackerel (*Trachurus symmetricus*), and the lanternfish *Diogenichthys laternatus* completed the ten most abundant taxa ranking 8th, 9th, and 10th respectively; however, none of these taxa ranked in the top ten in occurrence (24th, 14th, 16th respectively) suggesting relatively large sample sizes. These 10 top-ranking taxa contributed 90.5% of all larvae taken during 1960. The remaining 9.5% is represented by 146 taxa plus the unidentified and disintegrated categories. Of the 10 taxa, 5 were midwater species, 2 were coastal demersal species or generic groupings, and 3 were coastal pelagic species.

## EXPLANATION OF TABLES

Table 1 - This table lists by cruise the pertinent station and tow data for 1960, the volume of water filtered and standard haul factor for each tow, the percent of sample sorted, and the total numbers of fish eggs and larvae. CalCOFI cruises are designated by four digits; the first two indicate the year and the second two the month. Within each cruise the data are listed in order of increasing line and station number (southerly and seaward directions); the order of station occupancy is shown on the station charts (Figures 2-11). Stations are designated by two groups of digits; the first set indicates the line and decimal fraction and the second set indicates the station on the line. Time is listed as Pacific Standard Time at the start of each tow in 24-hour designation. Methods for determining tow depth, volume of water strained, standard haul factor, and percent sorted were described in the methods section. The values for total fish eggs and larvae represent raw counts (unadjusted for percent sorted or standard haul factor). Ship codes are as follows: BD, *Black Douglas*; HS, *Hugh M. Smith*; HO, *Horizon*; OR, *Orca*; SB, *Spencer F. Baird*.

Table 2 - This table lists pooled occurrences of all larval fish taxa taken during 1960 in ranked order.

Table 3 - This table lists pooled counts of all larval fish taxa taken during 1960 in ranked order. Numbers are adjusted for percent sorted and standard haul factors.

Table 4 - This table gives numbers of fish larvae for each taxon, listed by station and calendar month in which the tow was taken. Counts are adjusted for percent of sample sorted and standard haul factor. Average values are given for stations occupied more than once during a month. See Table 1 for station and tow data and Table 6 for listing of stations with multiple occupancies during a month. Multiple occupancies occurred when a station was occupied more than once during a calendar month; in some cases, multiple occupancies resulted from separate cruises. The orders are listed in "phylogenetic" sequence modified from Nelson (1984). Subtaxa within each order are listed alphabetically. Page numbers for each taxon are given in the index at the end of the report.

Table 5 - This table is a summary of pooled occurrences of all larval fish taxa taken on CalCOFI surveys from 1951 to 1960. Taxa are listed in the same order as in Table 4.

Table 6 - List of stations with multiple occupancies in one month during 1960.

#### ACKNOWLEDGMENTS

Elbert Ahlstrom, Lois Hunter, David Kramer, and Elizabeth Stevens originally identified larvae from CalCOFI cruises of 1960. Ronald Whyte coded each larval fish taxon or type and Rita Ford entered them into the computer. Debby Snow efficiently assisted in all aspects of data editing and retrieval. Cindy Meyer, Larry Zins, and James Ryan provided programming assistance. Dorothy Roll designed the CalCOFI data acquisition system and provided data processing support. Ken Raymond, Roy Allen, and Henry Orr helped with graphics and production of the report. Lorraine Prescott and Diane Forsythe prepared the manuscript for printing. Paul Smith determined statistical outliers, provided assistance during geographical outlier checks and offered helpful suggestions throughout the project. Izadore Barrett, Director of the Southwest Fisheries Center and Reuben Lasker, Chief, Coastal Fisheries Resources Division, SWFC, provided the support critical to the completion of the project. James Threlkeld planned CalCOFI surveys and supervised cruises, data handling, and plankton sorting from 1949 to 1986 and is largely responsible for the high quality of these operations. Without the vision and direction of Elbert Ahlstrom and Elton Sette and the dedicated efforts of the many people who collected, processed, and analyzed the samples, this data base would not exist.

TABLE 2. Pooled occurrences of fish larvae taken during CalCOFI cruises in 1960.

Rank	Taxon	Occurrences
1	<i>Engraulis mordax</i>	979
2	<i>Triphoturus mexicanus</i>	808
3	<i>Vinciguerria lucetia</i>	635
4	<i>Sebastes</i> spp.	572
5	<i>Leuroglossus stilbius</i>	505
6	Disintegrated fish larva	482
7	<i>Merluccius productus</i>	468
8	<i>Protomyctophum crockeri</i>	417
9	<i>Stenobrachius leucopsarus</i>	386
10	Unidentified fish larva	343
11	Myctophidae	317
12	<i>Lampanyctus ritteri</i>	311
13	<i>Cyclothona</i> spp.	271
14	<i>Trachurus symmetricus</i>	227
15	<i>Tarletonbeania crenularis</i>	222
16	<i>Diogenichthys laternatus</i>	210
17	<i>Lampanyctus</i> spp.	209
18	<i>Bathylagus ochotensis</i>	190
19	<i>Bathylagus wesethi</i>	184
20	<i>Melamphaes</i> spp.	157
21	<i>Ceratoscopelus townsendi</i>	156
22	<i>Citharichthys</i> spp.	151
23	<i>Stomias atriventer</i>	142
23	<i>Sardinops sagax</i>	142
25	<i>Citharichthys fragilis</i>	137
26	<i>Diogenichthys atlanticus</i>	121
27	<i>Citharichthys xanthostigma</i>	117
28	<i>Symbolophorus californiensis</i>	109
29	Paralepididae	108
30	<i>Citharichthys stigmaeus</i>	101
31	<i>Diogenichthys</i> spp.	97
32	<i>Icichthys lockingtoni</i>	86
33	<i>Diaphus</i> spp.	76
34	Labridae	75
35	Sciaenidae	74
36	<i>Hygophum</i> spp.	73
37	<i>Chauliodus macouni</i>	69
38	Gobiidae	67
39	Sternopytchidae	66
40	<i>Notoscopelus resplendens</i>	64
40	<i>Sympfurus</i> spp.	64
42	Scopelarchidae	63
43	<i>Gonichthys tenuiculus</i>	55
44	<i>Argentina sialis</i>	53
45	<i>Synodus</i> spp.	51
46	<i>Lyopsetta exilis</i>	50
47	<i>Hypsoblennius</i> spp.	47

TABLE 2. (cont.)

Rank	Taxon	Occurrences
48	<i>Lampadена urophaos</i>	46
49	<i>Scomber japonicus</i>	45
49	Trichiuridae	45

TABLE 4. Numbers of fish larvae taken on stations occupied during CalCOFI cruises in 1960. Counts are adjusted for percent of sample sorted and standard haul factor (see text). Average number is given for stations occupied more than once during a calendar month. Unoccupied stations are indicated by a dash.

## INDEX

This index lists taxa included in Table 4 with their page numbers.

	Page
<b>Anguilliformes .....</b>	81
<b>Clupeiformes</b>	
<b>Clupeidae</b>	
<i>Etrumeus acuminatus</i> .....	81
<i>Sardinops sagax</i> .....	82
<b>Engraulidae</b>	
<i>Engraulis mordax</i> .....	83
<b>Salmoniformes</b>	
<b>Argentinidae</b>	
<i>Argentina sialis</i> .....	89
<i>Microstoma microstoma</i> .....	90
<i>Nansenia candida</i> .....	91
<i>Nansenia crassa</i> .....	91
<b>Bathylagidae</b>	
<i>Bathylagus spp.</i> .....	92
<i>Bathylagus milleri</i> .....	92
<i>Bathylagus ochotensis</i> .....	93
<i>Bathylagus pacificus</i> .....	96
<i>Bathylagus wesethi</i> .....	96
<i>Leuroglossus stilbius</i> .....	98
<b>Osmeridae</b> .....	102
<b>Stomiiformes .....</b>	102
<b>Gonostomatidae</b>	
<i>Cyclothona spp.</i> .....	103
<i>Diplophos taenia</i> .....	106
<i>Ichthyococcus spp.</i> .....	106
<i>Vinciguerria lucetia</i> .....	107
<b>Sternopychidae</b> .....	112
<b>Stomiatoidea</b>	
<b>Chauliodontidae</b>	
<i>Chauliodus macouni</i> .....	113
<b>Idiacanthidae</b>	
<i>Idiacanthus antrostomus</i> .....	115
<b>Malacosteidae</b>	
<i>Aristostomias scintillans</i> .....	116
<b>Melanostomiidae</b>	
<i>Bathophilus spp.</i> .....	116
<i>Tactostoma macropus</i> .....	116
<b>Stomiidae</b>	
<i>Stomias atriventer</i> .....	116
<b>Myctophiformes .....</b>	119
<b>Alepisauroidei</b>	
<b>Evermannellidae</b> .....	119
<b>Paralepididae</b> .....	119
<b>Chlorophthalmoidei</b>	
<b>Notosudidae</b>	

	Page
<i>Scopelosaurus</i> spp. ....	121
Scopelarchidae .....	121

## RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167. Paper copies vary in price. Microfiche copies cost \$4.50. Recent issues of NOAA Technical Memorandums from the NMFS Southwest Fisheries Center are listed below:

- NOAA-TM-NMFS-SWFC- 78 Results of the Bay Area Sportfish Economic Study (BASES)  
C.J. THOMSON and D.D. HUPPERT  
(August 1987)
- 79 Ichthyoplankton and station data for California Cooperative  
Oceanic Fisheries Investigations survey cruises in 1951.  
D.A. AMBROSE, R.L. CHARTER, H.G. MOSER and C.R. SANTOS  
METHOT  
(September 1987)
- 80 Ichthyoplankton and station data for California Cooperative  
Oceanic Fisheries Investigations survey cruises in 1952.  
E.M. SANDKNOP, R.L. CHARTER, H.G. MOSER, and J.D. RYAN  
(September 1987)
- 81 Ichthyoplankton and station data for California Cooperative  
Oceanic Fisheries Investigations survey cruises in 1953.  
E.G. STEVENS, R.L. CHARTER, H.G. MOSER, and M.S. BUSBY  
(September 1987)
- 82 Ichthyoplankton and station data for California Cooperative  
Oceanic Fisheries Investigations survey cruises in 1954.  
B.Y. SUMIDA, R.L. CHARTER, H.G. MOSER, and D.L. SNOW  
(September 1987)
- 83 Ichthyoplankton and station data for California Cooperative  
Oceanic Fisheries Investigations survey cruises in 1955.  
D.A. AMBROSE, R.L. CHARTER, H.G. MOSER, and C.R. SANTOS  
METHOT  
(September 1987)
- 84 Ichthyoplankton and station data for California Cooperative  
Oceanic Fisheries Investigations survey cruises in 1956.  
E.G. STEVENS, R.L. CHARTER, H.G. MOSER, and M.S. BUSBY  
(September 1987)
- 85 Ichthyoplankton and station data for California Cooperative  
Oceanic Fisheries Investigations survey cruises in 1957.  
B.Y. SUMIDA, R.L. CHARTER, H.G. MOSER, and D.L. SNOW  
(September 1987)
- 86 Ichthyoplankton and station data for California Cooperative  
Oceanic Fisheries Investigations survey cruises in 1958.  
E.M. SANDKNOP, R.L. CHARTER, H.G. MOSER, and J.D. RYAN  
(September 1987)
- 87 Ichthyoplankton and station data for California Cooperative  
Oceanic Fisheries Investigations survey cruises in 1959.  
E.G. STEVENS, R.L. CHARTER, H.G. MOSER, and M.S. BUSBY  
(September 1987)
